

Learn more about our ecosystem

The entire ecosystem is made of 3 applications:

Gold Wallet – mobile app used for storing, sending, and receiving BTCV

Key Generator – web app used for generating your public and private keys

Electrum Vault – desktop app used for storing, sending, and receiving BTCV

Our mobile and desktop applications include 3 wallet types:

Standard – allows you to make transaction secured with one key

2-Key Vault – allows you to make transactions secured with two keys

3-Key Vault – allows you to make transactions secured with three keys

We distinguish 4 different transactions in our wallets:

Standard – default transaction available in a Standard wallet

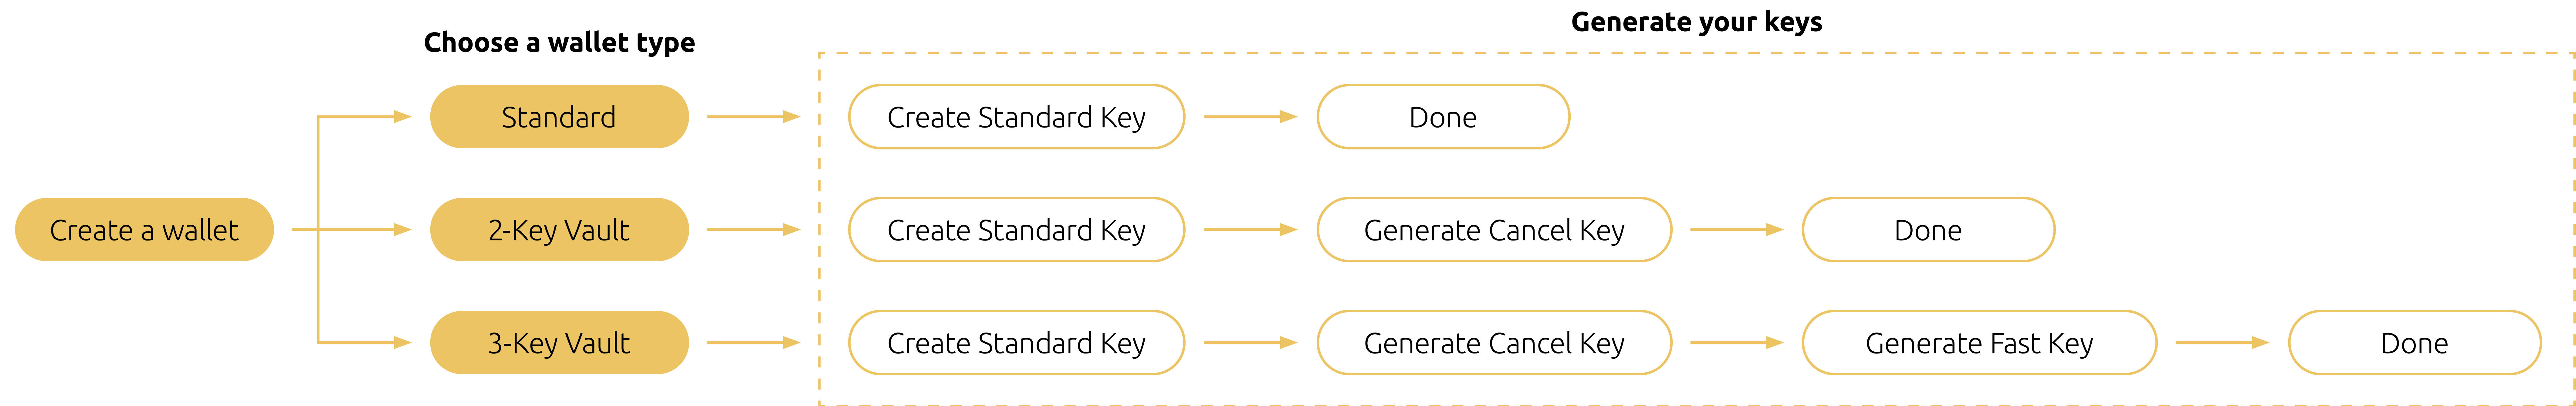

Secure – intentionally delayed transaction (~24 h) in a 2-Key Vault and 3-Key Vault wallets

Cancel – allows you to cancel Secure transaction in a 2-Key Vault and 3-Key Vault wallets

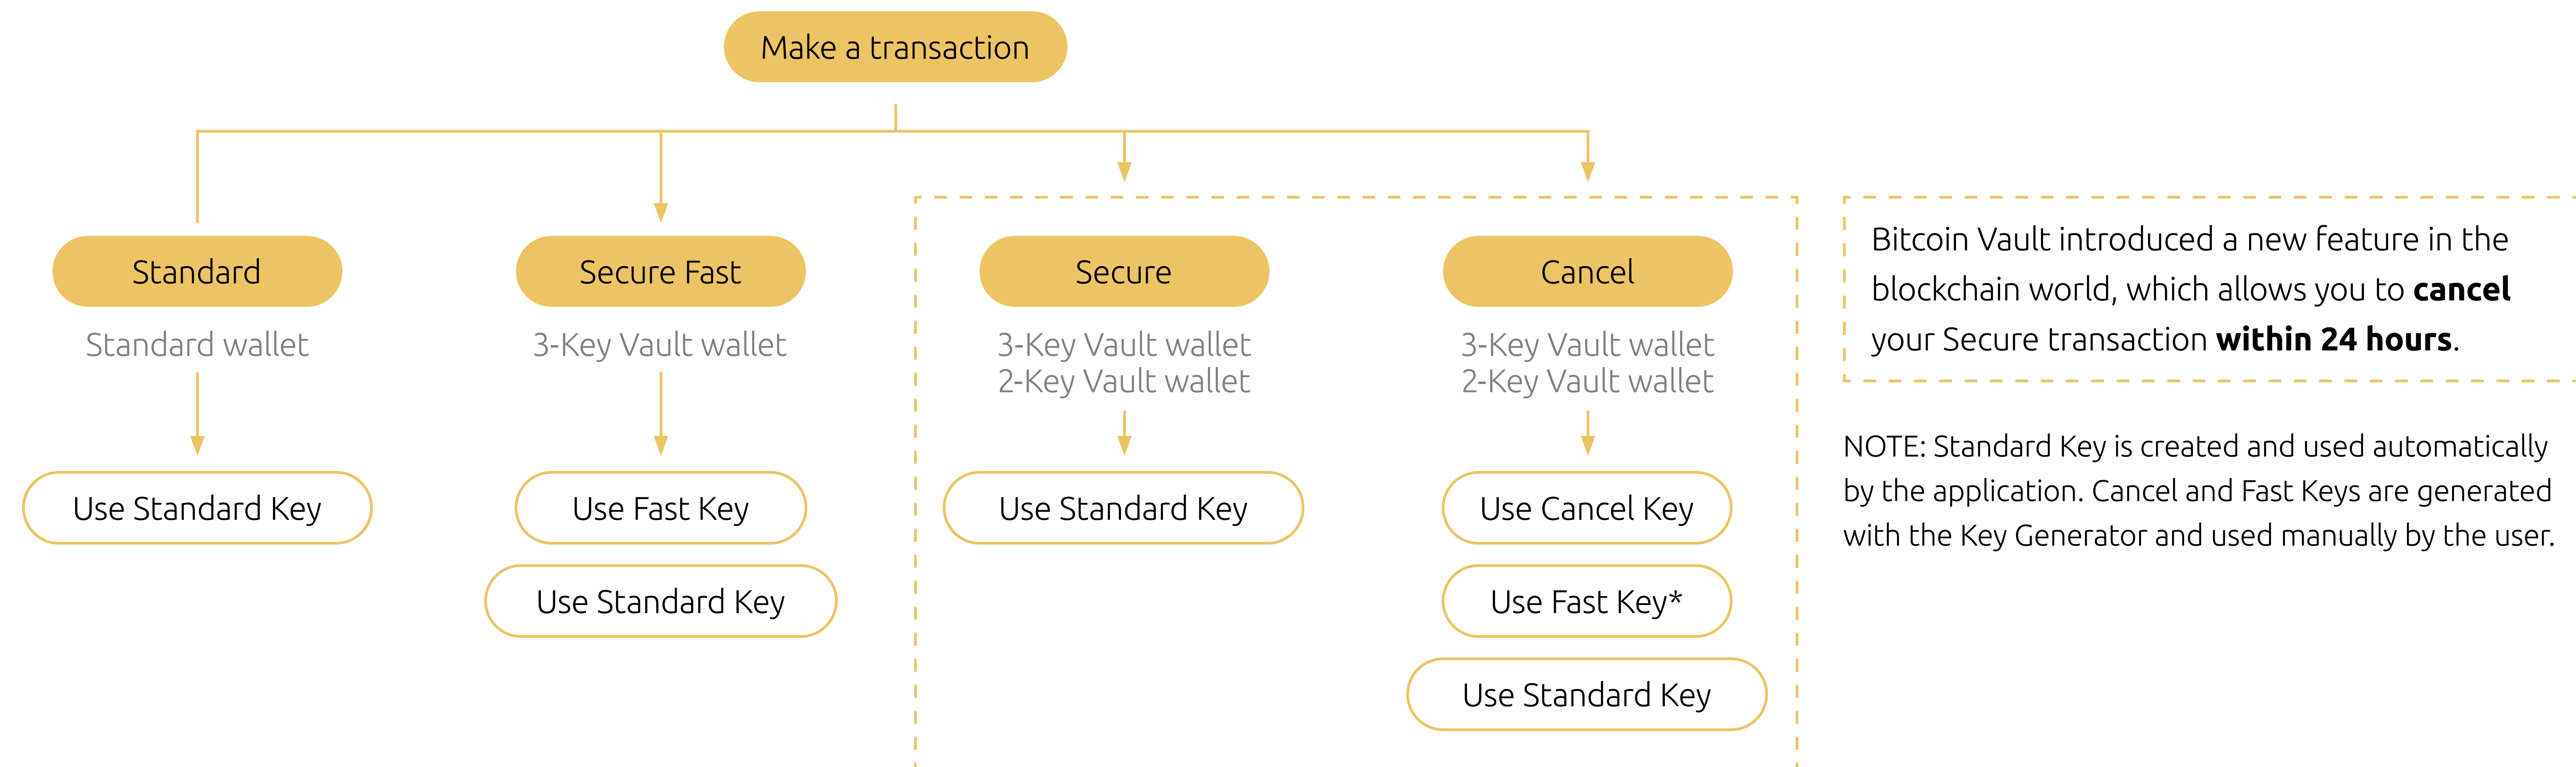

Secure Fast – instant transaction available in a 3-Key Vault wallet

NOTE: “Blocked UTXO” is a blocked amount of BTCV that you will see in your “Blocked balance”. Once your Secure or Cancel transaction is complete, the funds will be unblocked and again available in your “Available balance”.

How to create a wallet step by step
